The EVN Gbit/s e–VLBI data acquisition and playback system

Jouko Ritakari
Metsähovi Radio Observatory
Jouko.Ritakari@hut.fi
Original Goals

- Low cost
- Use of standard technology
- Minimal design work, fast deployment
- Modularity: Core VSI–H recorder + adapters
- 512 Mbit/s recording with one office PC
- Expandability: Gigabit/s recording with two office PCs
Non-goals
(Things nice to have but not worth additional effort)

- Mixed-mode disk and tape sessions
- No need, the new system is inexpensive
- Real-time VLBI
  - Internet is better in handling ftp than real-time data streams
  - Near real-time is easier and good enough
- Preserving the old tape formats
Things to Avoid

- Proprietary data formats
- Real-time data streams
- Need for guaranteed bandwidth
- VLBI-specific protocols
- Real-time operating systems
Initial phase

- Spring 2001: Evaluation phase
  - PCI interface: PLXtech vs. Xilinx core.
  - Architecture: Fifos, dual-port RAM, ping-pong buffers or bus-master DMA

- May–June 2001: First prototype
  - PLX prototyping kit connected to Xilinx evaluation card with flat cables

- June–July: Study of sustained disk performance in Linux computers (Ari Mujunen)
Second prototype

- August 2001: First version of VLBA sampler to VSI converter
- September–October 2001: VHDL programming and simulation
- October–December 2001: VSI input module PCB design
- January 2002: Second version of VSI converter
The MRO Gigabit Solution

Just delay the 1PPS marker, that’s all. Multi-Gbit/s data stream is fanned out to 2,3,4,5,6... units.

If rising_edge(VSIclk) then
  VSIdata2 <= VSIdata;
  pps_delayed <= VSI1pps;
  Pvalid2 <= Pvalid;
  if (gigabit_mode = '1') then
    VSI1pps2 <= pps_delayed;
  else
    VSI1pps2 <= VSI1pps;
  end if;
end if;
The "Metsähovi Milking Machine"

- Originally the board was to be a test vector generator and VLBA sampler interface.
- Lots of differential signalling in VLBI: Made sense to wire all the signals to RS422/ECL line receivers.
- Oops, this thing can emulate Mark5, both for WDB and IOB cables, parity or no parity...
- And finally we needed a thumbwheel switch...
What we have now

- Three VSI input/output boards tested
- 512 Mbit/s sustained speed with one office PC
- Multi-gigabit/s speeds with several office PCs
- Compatibility with Mark5 and the Japanese Gigabit VLBI system
- Ready for volume production
