### The 10th International VLBI Technology Workshop

The **10th International VLBI Technology Workshop (IVTW)** will take place October 21-24, 2025. The meeting will be hosted by [Chalmers University of Technology, Onsala Space Observatory](#), in Gothenburg, Sweden.

The scope of the workshop is to encompass all areas of VLBI hardware and software development and techniques on frontends, backends, recorders, correlation, image processing, potential space VLBI missions and RFI monitoring, mitigation and other strategies in today's rapidly changing environment.

In addition, we plan to arrange a visit to the [clean room facility](#) at Chalmers campus, used by the Onsala [GARD](#) group for receiver development, as well as a site visit to the Onsala Space Observatory. The [observatory](#) is located 45 km from Chalmers campus (and the city centre).

#### Program overview

- Optional: Tuesday, October 21: Visit to Clean room, GARD.
- Tuesday, October 21, Icebreaker, Chalmers area
- Wednesday, October 22: meeting, Chalmers, Veras Gräsmatta
- Thursday, October 23: meeting, Chalmers, Veras Gräsmatta
- Friday, October 24: meeting, Chalmers, Veras Gräsmatta
- Optional: Saturday, October 25: Visit Onsala Space Observatory

The registration fee for the IVTW is 1000 SEK, including VAT. This fee covers the icebreaker reception, coffee breaks, lunches, the conference dinner and the visit to Onsala Space Observatory.

The conference is sponsored by [thematic area Space](#) at Chalmers.

# Antenna Gain Calibration

Slides from seminar: Station Amplitude Calibration (Eskil Varenius)

# Why is calibration important?

# Why is calibration important?

- Surprisingly faint source → No detection → time wasted & bad data
- Surprisingly strong source → “Too good” → time wasted
- VGOS observe dual linear (H,V) polarisations
- Geodetic analysis simpler in circular polarisation
- Can convert from linear → circular using e.g. “polconvert”
- Monitoring source flux density is interesting for astronomy!
- Regular monitoring is hard to get with astro-VLBI networks.
- With ampcal in IVS, we may get astronomical discoveries “for free”.

VGOS goal – source structure...

# Why is calibration important?

Experimental Astronomy (2022) 54:137–155

# SEFD

- SEFD is the "system equivalent flux density" (Jy), defined as the flux density of a radio source that doubles the system temperature. Lower values of the SEFD indicate more sensitive performance. Unit is Jansky.

Example:

- Assume SEFD=2000 Jy at 8 GHz towards empty sky at el=45 deg.
- If we observe a 2000 Jy source in this direction, RF power doubles.

# ONOFF result

**Gain Compression** - This is obtained by calculating the ratio of variation in counts switching the cal on when on source to the change in counts when off source. This ratio should be close to one as much as possible.

$$\text{Comp} = \frac{\text{ONSC} - \text{ONSO}}{\text{OFFC} - \text{OFFS}}$$

$$\text{SEFD} = S \times \frac{\text{OFFS} - \text{ZERO}}{\text{ONSO} - \text{OFFS}}$$

$$\text{SEFD} = 369.4 \text{ Jy} \times (8711.3 - 0) / (15264.3 - 8711.3) = 491 \text{ Jy}$$

$$T_{\text{sys}} = T_{\text{cal}} \times \frac{\text{OFFS} - \text{ZERO}}{\text{OFFC} - \text{OFFS}}$$

$$T_{\text{cal}}(\text{Jy}) = S \times \frac{\text{OFFC} - \text{OFFS}}{\text{ONSO} - \text{OFFS}}$$

$$T_{\text{cal}}(\text{K}) = \text{DPFU} \times \text{gain}(\text{el}) \times T_{\text{cal}}(\text{Jy})$$

$$T_{\text{cal}}(\text{r}) = T_{\text{cal}}(\text{K}) / T_{\text{cal,rxg}}(\text{K})$$

The table shows the median absolute amplitude error for EVN stations. These results were derived from the pipeline amplitude self-calibration results.

# Feedback from JIVE

# Summary

- Amplitude calibration will be important for optimal geodetic results
- Requirements: a working noise diode and a backend capable of communicating TPI values (preferably with FS) every second
- Stations: Measure GAIN and TCAL (FS)!
- FS tools ONOFF, ACQUIR and GNPLT can help you – please experiment!
